
M0 = age, sex · M1 = + BMI, race/ethnicity, income · M2 = + smoking, diabetes, hypertension, cholesterol, HDL, eGFR · M3 = M2 + log NLR + log hs-CRP. Hollow markers = random forest trained with class weighting (its Brier scores for M0–M2 are not comparable and are left out). Test-set CIs are about ±0.04 for ROC-AUC (see the individual results); Figure 2 shows the marker gain with CIs.
